

Amendments to the Drawings:

The attached sheets labeled "Replacement Sheet" include changes to FIG. 4.

In the amended FIG. 4, symbol 68A is added to represent a bottom surface of the chamber 68, symbol 68B is added to represent an inner circumferential wall of the chamber 68, and symbol 52A is added to represent an axis of rotation of the rotating device 52.

The features have been clearly shown in the original drawings. So, no new matter is added.

REMARKS/ARGUMENTS

The specification and drawing have been correspondingly amended without adding new matters and will be explained as below.

5 In the amended specification and drawing, the chamber 68 has a bottom surface 68A facing the cleaning device 54, and an inner circumferential wall 68B connected to the bottom surface 68A, and the bottom surface 68A of the chamber 68 is substantially in parallel with an axis 52A of rotation of the rotating device 52. It is to be noted that the axis of rotation of the rotating device can be easily
10 derived according to that "*the cleaner is ejected from the cleaning device 54 to the chamber 68 in a direction opposite to a direction of a centrifugal force of the combination of the substrate 64 and the frame layer 66, so that the chamber 68 of the combination may be cleaned by the cleaner*". In addition, two combinations of the substrates and the frame layers are disposed on the rotating device 52 and
15 opposite to each other, as shown in FIG. 4. Also, the specification also has been amended to recite that the chamber 68 faces the cleaning device 54 rather than the periphery wall 58 of the cleaning device 54 because the periphery wall 58 does not pertain to the cleaning device 54, as shown in the original FIG. 4. These features have been clearly shown in the original drawings, so no new matter is
20 added.

Claims 1-6 are now present in this application. Claim 1 has been currently amended according to the amended specification and FIG. 4. Claim 6 has been
25 added.

Claim Objections

Claim 1 has been amended to cancel the reference numerals for some of the parts of the apparatus.

Claim rejections – 35 U.S.C. 103

Claims 1-5 are rejected under 35 U.S.C. 103(a) as being unpatentable over

Dordi et al. herein referred to as "Dordi" (US Patent No. 6,416,647) and further in view of Bran (US Patent No. 6,681,782).

Claim 1 has been amended to recite that the chamber has a bottom surface facing the cleaning device, and an inner circumferential wall connected to the bottom surface, and the bottom surface of the chamber is substantially **in parallel** with an axis of rotation of the rotating device.

In Bran, however, the bottom surface (bottom surface of 106) of the chamber is substantially **perpendicular** to an axis of rotation of the rotating device, as shown in the following drawing.

10

Considerations of the amended claim 1 and its dependent claims 2-5 are therefore politely requested.

Introduction to the newly added claims

15

Claim 6 has been added to recite that another combination of another substrate and another frame layer arranged on the substrate is disposed on the rotating device and disposed opposite to the combination of the substrate and the frame layer. The recited patents never disclose or teach these features.

Consideration of the new claim 6 is politely requested.

5 In light of the above-mentioned amendments and remarks, Applicant now asserts that all of the grounds for objections and rejections have been traversed or overcome by amendments, and that all of the present claims are in condition for immediate allowance. Applicant therefore requests reconsideration of the objections and rejections, and solicits allowance of the present claims at an early date.

Thank you for your consideration.

10 Respectfully submitted,

R. Willgohs
